RESEARCH HISTORY

2018 – Present

Weak gravitational lensing

Developed a novel method for measuring the second-order weak gravitational lensing effect known as flexion; Created a full theoretical formalism for “cosmic flexion” – a family of cosmological weak lensing signals originating from the large-scale structure of the universe; Discovered previously unknown cosmological weak lensing signals and posited the existence of non-commutativity in weak lensing; Exploration of flexion in the Dark Energy Survey; Discovered unique weak lensing signatures for negative mass compact objects and exotic objects such as the Ellis wormhole.

- 2015 – 2019 **Low redshift 21 cm intensity mapping**
Cosmological parameter and modified gravity forecasts for a general 21 cm cosmology experiment, member of the DOE Cosmic Visions Dark Energy 21 cm Working Group, and design and construction of the radio telescope used for the 21 cm Baryon Mapping eXperiment at Brookhaven National Laboratory.
- 2013 **Gravitational waves**
New method for the indirect detection of gravitational waves.
- 2012 **Modified Newtonian Dynamics**
Investigated the plausibility of Modified Newtonian Dynamics on a local scale based on rotation curves of the Milky Way.
